Royalties for Regions

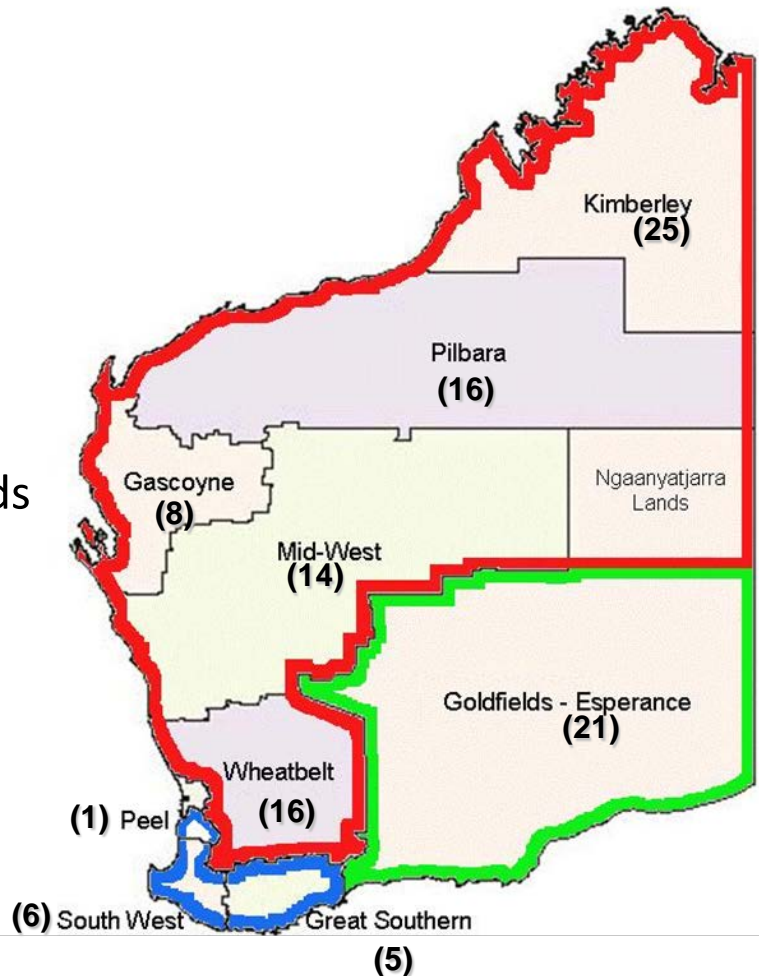

25% of the State's mining and onshore petroleum royalties is returned to the regions as additional investment in projects, infrastructure and community services

Regional Mobile Communications Project

No. Sites in each region

- Kimberley (25)
- Pilbara (16)
- Gascoyne (8)
- Mid-West (14) including Ngaanyatjarra Lands
- Wheatbelt (16)
- Goldfields – Esperance (21)
- Peel (1)
- South West (6)
- Great Southern (6)

Priority 1. **(80)**
Priority 2. **(22)**
Priority 3. **(11)**

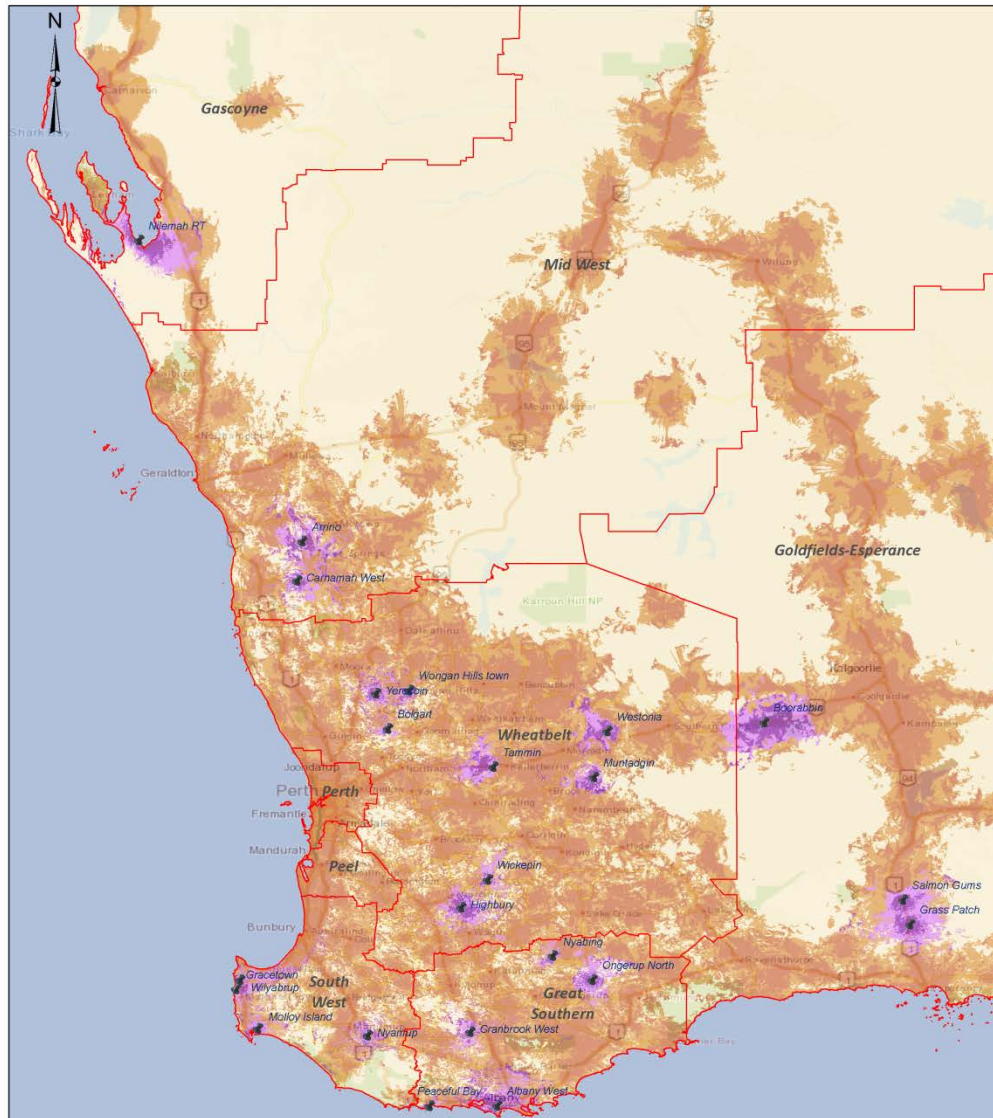

Legend

- New RMCP Coverage
- New RMCP Coverage with External Antenna
- Existing Next G[®] Coverage
- Existing Next G[®] Coverage with External Antenna

Customers should be aware that the Telstra mobile coverage areas displayed have been created using data that predict the likely areas of coverage. Not every particular location within the identified coverage areas has been individually tested for coverage. This means that while the footprint of coverage outlined on the map is generally accurate, there will be specific areas, especially in being within a coverage area where a customer's mobile phone will not work. This is a common characteristic of wireless systems. For example, coverage could be degraded or non-existent in specific locations due to certain physical structures or geographic features. Physical structures which may block or inhibit coverage could include basements, lifts, underground car parks, concrete buildings, tunnels and road cuttings. Geographic features could include formations such as hills and mountains or even trees.

Data supplied experienced on Telstra's mobile networks may be affected by network availability, the type and configuration of customer equipment, the performance of external networks (for example the Internet), the signal strength of the device used and other factors such as the type of location being used.

Proposed RMCP coverage reflects Telstra's best estimate of indicative coverage based on likely siting and configuration of new base stations which will only be confirmed once the new sites are acquired. Actual coverage will be subject to confirmation of exact site location and equipment configuration within the site, especially the precise location of new towers in relation to the local terrain.

Customers should be aware that the Telstra mobile coverage maps displayed have been created using tools that predict the likely areas of coverage. Not every particular location within the identified coverage areas has been individually tested for coverage. This means that while the footprint of coverage outlined on the map is generally accurate, there will be specific areas described as being within a coverage area where a customer's mobile phone will not work. This is a common characteristic of wireless systems. For example, coverage could be degraded or not received in specific locations due to certain physical structures or geographic features. Physical structures which may block or inhibit coverage could include basements, lifts, underground car parks, concrete buildings, tunnels and road cuttings. Geographic features which may block or inhibit coverage could include formations such as hills and mountains or even trees.

Data trends experienced in Telstra's mobile networks may be affected by network availability, the type and configuration of customer equipment, the performance of external networks (for example the Internet), the signal strength of the device used and other factors such as the type of application being used.

Forecasted RMCP coverage reflects Telstra's best estimate of indicative coverage based on likely siting and configuration of new base stations which will only be confirmed once the new sites are acquired. Actual coverage will be subject to confirmation of exact site location and equipment configuration within the site, especially the precise location of new towers in relation to the local terrain.
